

Order Picker / Stock Picker - Answer Key

1. The main difference with an order picker is that:
A - The operator is elevated with the platform
2. When required by the truck/manufacturer, the operator should use:
A - The approved fall-protection/restraint system and anchorage
3. If an item is out of reach, the operator should:
A - Reposition rather than overreach
4. People should be kept:
A - Clear of the area below/around the elevated work platform
5. Overhead hazards can include:
A - Rack beams, sprinklers, pipes and structure
6. Platform floor should be:
A - Kept clear and loads stable
7. Emergency lowering procedures should be:
A - Known before work at height
8. Travel with the platform elevated should:
A - Follow manufacturer and employer rules
9. Fall-protection equipment should be inspected:
A - Before use according to the employer/manufacturer program
10. This course replaces practical training/evaluation.
A - False

Equipment-specific formal instruction. Practical training and workplace evaluation are required; fall protection must follow the truck/manufacturer and employer requirements.
